

WELLSOFT

THE HEART OF YOUR EMERGENCY DEPARTMENT

WELLSOFT® EDIS IMAGE CAPTURE

Patient ID / Photos

View patient image data at the point of care using Wellsoft's user-friendly photo capture utility. Patient images can be imported from attached webcams or rapidly transferred from digital cameras or flash storage media. This functionality is useful in patient identification, risk management, and wound or abuse cases, among others. For patient identification, the image can be placed in the patient summary bar at the top of each record. This image is visible on the Triage Display, Chart Display and any other patient record display. Wound, or any other body images, can be easily embedded in the clinical documentation.

Wellsoft's Image Editor allows end-users to quickly enable a webcam, take or erase a photo, zoom in or out, browse through all images within a particular record or print thumbnail or full-sized images.

Anatomical Diagrams

Wellsoft EDIS incorporates detailed anatomical images which can be embedded within clinical documentation. These easily accessible images can be annotated with a mouse, stylus, or touch screen to indicate lacerations, edemas, etc. Clinical findings can be included above or below an image thumbnail if there is a need to expound upon any annotations.

Wellsoft's Image Editor allows end-users to quickly change a particular diagram's orientation from left to right, zoom in or out, browse through all images within a particular record or print thumbnail or full-sized images.

Scanning

Reduce the costs associated with storing and duplicating paper documents and increase the accessibility of your documents by scanning them directly into patient charts. Wellsoft EDIS allows for the scanning of both images and paper documents, such as EKGs and EMS run sheets, ID cards, or forms. Scanned documents can be viewed as thumbnails or full-sized images, and similarly printed in either format.

Embedded Forms

Wellsoft provides the ability to reproduce forms electronically, replacing your facility's standard paper forms with digital conversions that are stored, accessed and electronically signed within Wellsoft EDIS. The electronic signature can be permanently embedded in the patient record and secured by our comprehensive user access system.
